Centralized all-in-one cloud solution

We, at Eltima Software, are fans of all-in-one utilities combining many features and services in a simple manner. CloudMounter is the latest addition to our macOS software family.

In the days of affordable high-speed unlimited Internet connection and low-capacity SSD drives in personal MacBooks, cloud storage services are becoming more and more popular. There is no need to always carry removable disks to transfer information from one location to another and no need to keep all your data on local drives. Simply upload your files to a cloud server, and access them whenever needed even from a mobile device with fast mobile Internet connection or free Wi-Fi.

And with all the choices we have now it is not uncommon to have a number of different cloud accounts. This is where it becomes pretty handy to be able to manage all your clouds from a single point of access.

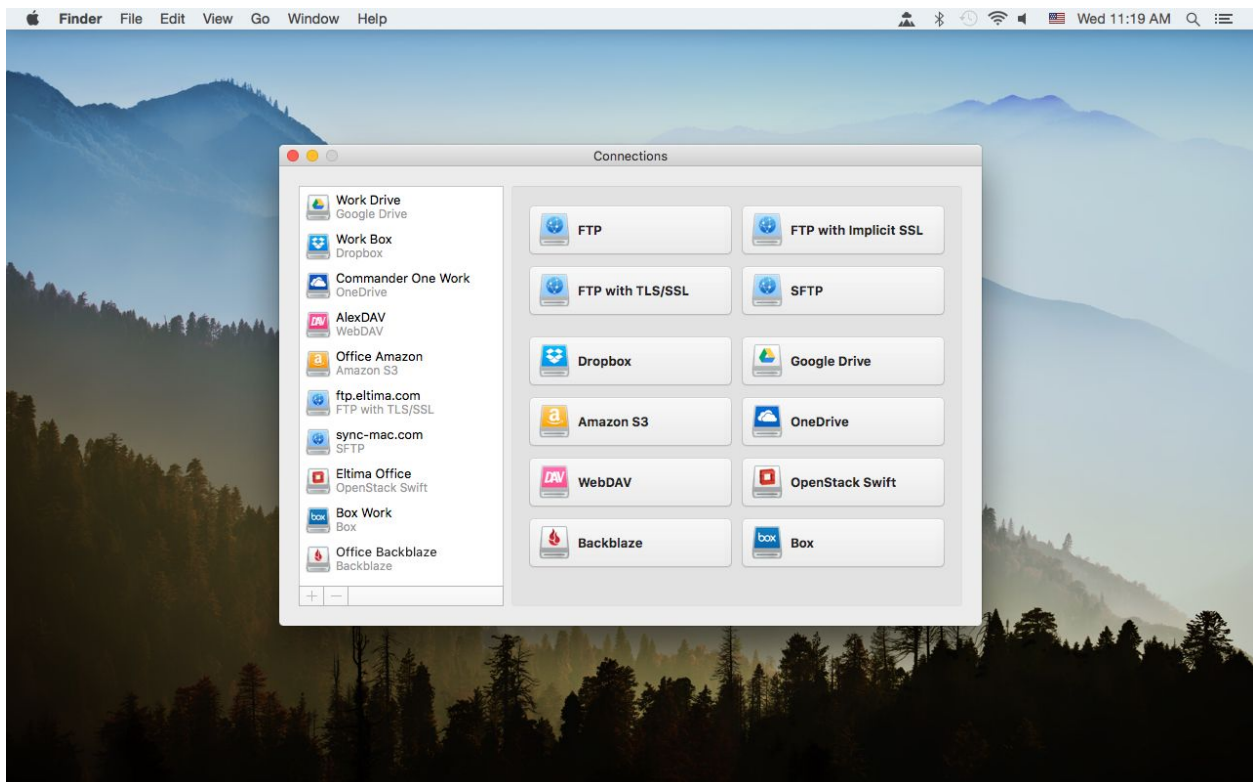

CloudMounter is our all-in-one solution for these purposes. This handy system utility allows mounting any number of cloud accounts on your Mac as regular local disks or network shares. Get access to your online files - view, edit, delete, create, as well as upload to and download files from your remote server or cloud storage. Unlike native clients of cloud services, CloudMounter does not sync your data to a local computer, you are working directly with online files, right from Mac Finder.

Connect and Manage

CloudMounter allows mounting any number of accounts of the following services:

- Google Drive (also for Windows OS)
- Microsoft OneDrive (also for Windows OS)
- Amazon S3 (including S3-compatible storages)
- Dropbox (also for Windows OS)
- FTP, FTPS and SFTP servers
- WebDAV servers
- OpenStack Swift storage system
- Box cloud service
- Backblaze B2 storage

We are constantly searching for the possible methods to expand the supported cloud resources and are already working to include several more in the nearest future. The last update brought the support for Box and Backblaze clouds, which we hope will be very useful to our users.

Encrypt and Protect

Thanks to this new feature all data you keep in clouds or on remote servers is reliably protected. There is no doubt about the security of FTP/SFTP/WebDAV servers or any supported Cloud Storages when you are using CloudMounter. You can easily set up data encryption and secure cloud storages and servers to access them only from your CloudMounter. If someone else attempts to access the storages from a different device or via another app they will see nothing but nonsense.

Intuitive and Simple

The way it works is really simple. The main window of the app is basically a connections manager with corresponding buttons for each supported service and protocol. Just choose what you want to connect, enter your login credentials and enjoy managing your online files on a mounted drive in Finder.

Security and Privacy

CloudMounter does not store your login details. Access to cloud services is performed through their developers' API, and FTP/WebDAV passwords are securely kept in Mac OS Keychain and sent directly to the servers via SSL-encrypted channels.

Pricing and Availability

The update 3.0 brought changes to the pricing policy: you can mount one Dropbox, Google Drive and OneDrive account without charge including the the ability to encrypt your online files in these storages.

CloudMounter is compatible with Mac OS 10.10+ and Win 7 SP1+. The licensed version can be purchased for \$44.99 and a trial is available for download from [CloudMounter official website](#).
